# Overview

- 1 Overview
- 2 Storage Types
- 3 Modeling
- 4 Metrics
- 5 Experimental System
- 6 Sensors
- 7 Sensors
- 8 Experimental Protocol
- 9 Summary

# Why Hydrogen Fuel?

- High specific energy content
- Relatively Abundant
- Low Emissions

- Infrastructure Integration
- Simple Production
- Relatively Renewable

# Hydrogen Storage

Can be stored in Liquid or Gaseous States

- Liquid Hydrogen Has very high Energy Density
- Gaseous Hydrogen uses cheap and simple storage

- Liquid Requires Complex Cryogenic Systems
- Gaseous Hydrogen Has to be Compressed to match acceptable energy density

# Modelling Temperature Distribution

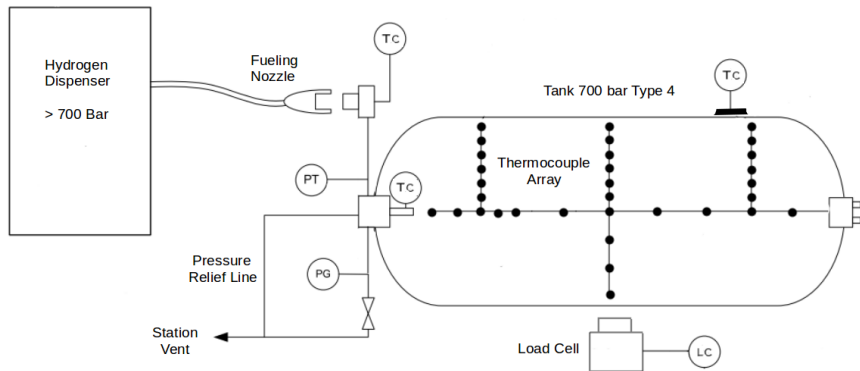

Temperature Distribution for 35MPa Tank during fast filling [Dicken, 2006]

# Problem and Constraints

- Map 2D temperature distribution inside tank
- Determine mass transfer during a fast fill.
- Determine Pressure during fast fill
- Semi-portable system
- No modifications to tank
- Adhere to SAEJ2601 standards

# Experimental Setup

# Data Acquisition System

# Temperature

Thermocouple:

- Type T Special Grade
- 0.012mm Diameter  $\tau = 0.4$  s
- $\pm 0.5^{\circ}\text{C}$  accuracy

ADC 2x NI 9213

- 16ch 24 bit ADC
- $\pm 78.125\text{mV}$  input range @ 78 S/s
- accuracy with type T  $\pm 0.02^{\circ}\text{C}$

# Temperature

## Thin-Film Heat Flux Sensor:

- Type K Standard Grade
- $\tau = 1.5$  s
- $\pm 1.1^{\circ}\text{C}$  accuracy

## ADC 2x NI 9213

- 16ch 24 bit ADC
- $\pm 78.125\text{mV}$  input range @ 78 S/s
- accuracy with type T  $\pm 0.02^{\circ}\text{C}$

# Pressure

## GEFRAN Diaphragm Transducer:

- 0-1000 Bar for 0-10V
- Response Time  $\leq 1\text{msec}$
- $\pm 0.5\%$  accuracy FS

## ADC 1x NI 9215

- 4ch 16 bit ADC
- $\pm 10\text{V}$  input range @ 100 kS/s
- $\leq 0.2\%$  error (calibrated)

# Mass Flow

Honeywell 3397 Load cell:

- 2mV/V  $\pm 0.25\%$
- 0-200lb range
- Universal Inline Amplifier  $\pm 10\text{Vdc}$

ADC 1x NI 9215

- 4ch 16 bit ADC
- $\pm 10\text{V}$  input range @ 100 kS/s
- $\leq 0.2\%$  error (calibrated)

# Procedure

- Purge Tank and Set Pressure to 50 Bar
- Allow Temperature/Pressure to Stabilize
- Record Initial Conditions
- Apply Required Ramp Rate
- Measure P, T @ 20S/s HF, m @ 1S/s during Fast fill
- Measure P, T @ 20S/s HF, m @ 1S/s during cool down
- Record Final Conditions
- Repeat for different array configurations

# Summary

Average Temperature = 335 K

Average Temperature = 332.4 K

- Temperature:  $T \pm 0.16\%$
- Pressure:  $P \pm 0.22\%$
- Heat Flux:  $HF \pm 0.4\%$
- Mass:  $m \pm 0.45\%$
