OBJECTIVES

Muons are an elementary particle (lepton) similar to the electron, with negative electric charge (-1) and a spin of 1âĄĎ2 and a mass of (105.7 MeV/c2). The muon is an unstable subatomic particle with a mean lifetime of 2.2 Âţs. The decay of the muon is mediated by the weak interaction exclusively. Muon decay always produces at least three particles, which must include an electron of the same charge as the muon and two neutrinos of different types as displayed in figure ??. For positively charged muons a positron and two neutrinos
